

Elevator pitch talk

I'm enrolled in a six month data science course of study to improve on my data science skills in Python, SQL, and machine learning. I taught mathematics and statistics for 20 years and I'm now looking for employment that allows me to solve problems such as prediction and classification, using a data science toolkit.

Currently I teach mathematics and science classes, but my dream is to work full-time in data science: I've enrolled in an intensive bootcamp style six month course for data science. I'm excited about solving problems using data science tools. I'm passionate about combining my background in mathematics and statistics with data science tools to solve interesting problems using data exploration and prediction or classification.

Recently I've been working on several Capstone projects in the Springboard coursework to improve my data exploration and prediction skills. In the past, I used data science tools to investigate problems in cancer and in Parkinson's disease, for example. What problems are the data scientists working on in your company?
